

SECURITY EXPLORER FOR SHAREPOINT

Security Explorer for SharePoint is a powerful, graphical solution for real-time management of SharePoint that dramatically simplifies SharePoint security with a full tree view of the SharePoint site, point-and-click permissions management, search, and backup and recovery of permissions.

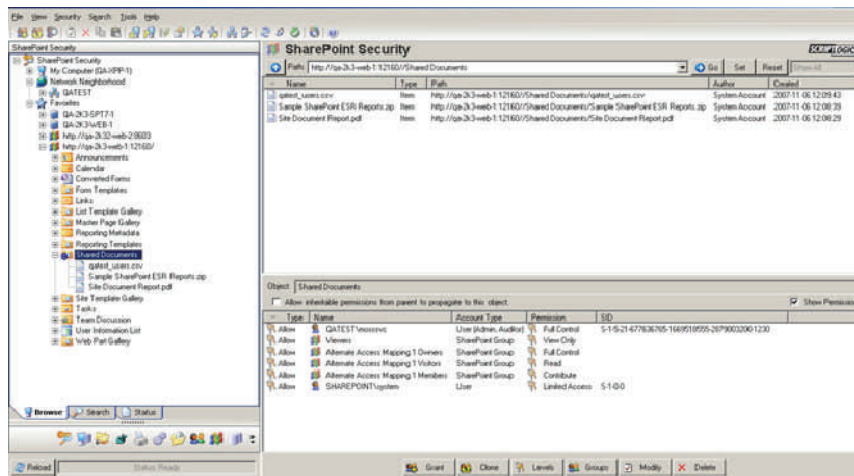

MANAGE SECURITY IN SHAREPOINT

Microsoft Office SharePoint Server was originally developed to help organizations provide business users better access to information and enable individuals in a company or between different companies the ability to work together to effectively share information. Unfortunately, that information sharing has caused an unprecedented number of attacks from both inside and outside the corporate network. With the growing emphasis on regulatory compliance requirements, the need to place strict security measures on the permissions within SharePoint has grown.

Given the fact that even non-technical users can manage their own permissions in SharePoint leads to further complexity. And unorganized permission assignments and a lack of centralized control over the enforcement of company policy require the need for extensive management and analysis of SharePoint permissions to ensure a secure and consistent implementation.

ScriptLogic's Security Explorer for SharePoint centralizes the management of SharePoint security and gives administrators the power to quickly assess, delegate, manage, and backup and recover permissions. This solution provides a security boundary around all SharePoint servers and helps companies meet compliance and security goals.

Security Explorer for SharePoint provides the ability to search, modify, delete, clone, backup and restore permissions with ease

POWERFUL, ROBUST YET SIMPLE PERMISSION

MANAGEMENT

- **Assess** SharePoint security with an intuitive interface that displays security information as each site, list, library, or document is selected
- **Search** for permissions to find security weaknesses and eliminate over-exposed resources
- **Delegate** permissions to groups using a birds-eye view of the SharePoint server and site collections
- **Clone** permissions between SharePoint or domain groups and users
- **Demonstrate** compliance with the ability to enforce security and manage access controls
- **Recover** security information on any SharePoint site or site item whose permissions have been unintentionally/intentionally modified

KEY BENEFITS

Increase Productivity

Get faster results and increase administrator availability with an intuitive, security focused interface, multi-threading and powerful search capabilities

Meet Compliance Objectives

Achieve compliance and reduce the time needed to implement security standards on SharePoint servers

Increase SharePoint Security Lockdown

SharePoint resources and avoid overexposed documents and libraries

KEY FEATURES

Simplified Security

Using a security-centric interface, the assessment, assignment and availability of SharePoint security can be accomplished across multiple servers and web farms

Search SharePoint

Rapidly scan for any combination of permissions granted to specific SharePoint or domain accounts. Find permissions that are either explicit or inherited.

Backup Permissions

Instantly recover permissions as a separate data set to restore security and meet corporate policy and compliance objectives

Clone Permissions

Easily transfer permissions from one account to another using Security Explorer's clone functionality

SYSTEM REQUIREMENTS

Security Explorer for SharePoint can manage permissions on Microsoft Office SharePoint Server 2007 and Windows SharePoint Services 3.0

LICENSING

Security Explorer for SharePoint is licensed by the total number of front end servers in a SharePoint farm.
